1 User Information

1.1 Introduction

The screenshot shows a window titled "User information such as password, name and email" with a user icon in the top right corner. Below the title bar, there is a user icon (a red and white beach ball) and the text "kde4" followed by the instruction "(Click the button to change your image)". The main content area is divided into two sections. The first section, titled "User Information", contains four text input fields labeled "Name:", "Organization:", "Email address:", and "SMTP server:". Below these fields, the "User ID:" is displayed as "501". A button labeled "Change Password..." with a key icon is located below the input fields. The second section, titled "At Password Prompt", contains three radio button options: "Show one star for each letter" (which is selected), "Show three stars for each letter", and "Show nothing".

This is a system settings module to enter user information and configure basic user settings such as the password and icon. This information and these settings will be used by various KDE applications (mail programs and word processors for example) if they are filled. You can:

- fill in personal information
- change your user login password
- set up the password prompt

1.2 User Icon

This icon is used when the user logs in using a login manager. Clicking on it will allow you to change the image, either by using a provided icon or by setting one of yours. Click Apply to validate your change.

1.3 User Information

Name: Enter here the full name of the user.

Organization You can add the business or group that the user would like to be associated with.

Email address: Enter here the email address which will be associated with this user.

SMTP server: You can indicate here a local smtp server for sending mail within a network.

User ID This is an information only, it gives you your User ID. This number is defined in `/etc/passwd` and was set when your user account was created.

Change password... Clicking this button will display a dialog to change your user password. Your user password is the one you log in your system with. You will be asked for your current password then twice for your new password.

1.4 At Password Prompt

This section allows you to choose how you want to input your password when you are asked for it. Default is to have one star for each letter you type. You can change that to have three stars for each letter you type (making it more difficult to guess the number of letters if someone is looking). You can also choose to have nothing displayed while you type your password, making this operation even more secure.
