1 The Validators Plugin

1.1 Using the Validators Plugin

The validator plugin can be accessed in the Konqueror menubar under Tools → Validate Web Page. A description of each subitem can be found below.

Validate HTML The validate HTML option allows you to compare your HTML document to the defined syntax of HTML and reports any errors found. Validating your HTML will ensure that your pages display properly on all browsers.

Validate CSS Allows you to validate your CSS style sheet that is embedded in an HTML or XHTML document. Having valid CSS is critical to ensuring that your web site maintains a consistent look regardless of the browser that is being used.

Validate Links Allows you to confirm that the links on your site contain no redirects or broken links. This tool recursively checks all links on a site.

Configure Validator The configure validator item allows you to view the preset validators you can use to validate your HTML and CSS.
