Abstract

KMoon is an applet that shows the current phase of the moon.

Chapter 1

Using KMoon

KMoon is a little applet that docks into the System Tray and shows an image of the current phase of the moon. Hovering the mouse cursor over the image brings up a tooltip to display more information.

KMoon can be added to the panel by right mouse button clicking on an empty space on the panel and choosing Add to Panel → Applet → Moon Phase Display. If you can't find an empty space, you can access the panel menu from an right mouse button click on any existing applet or icon.

To close KMoon right click on the applet handle beside the image and choose Quit.

1.1 Settings

If you right click on the image and choose Settings... a small dialog box will appear that lets you adjust the image to suit the latitude and hemisphere you are living in.

Appendix A

Installation

KMoon is part of KDE's kdetoys package.

Most Linux® / UNIX® distributions that include KDE will include kdetoys as an option to be installed if the user wishes.

KMoon and the kdetoys package may also be compiled from source code. Visit <http://www.kde.org> for instructions on how to download, compile and install KDE programs.
