The smb ioslave enables you to browse the shares of a Windows® (or Samba) network.

To see the workgroups, enter \texttt{smb:// .}

\texttt{smb:// a\_workgroup} will list the hosts in this workgroup.

To see the shares of a host, enter \texttt{smb:// the\_host or smb:// a\_workgroup / the\_host}.

To access a share directly enter \texttt{smb:// the\_host/the\_share or smb:// a\_workgroup / the\_host / the\_share}

The smb ioslave requires that you have libsmbcclient to use this ioslave.

You can set your default user name and password in the System Settings category \texttt{Network} in \texttt{Connectivity \rightarrow Windows Shares}. This is especially useful if you are a member of a Windows® NT domain. There you can also set your workgroup name, but in most cases this is not required. The kioslave will ask for your username and password if a default is not set.
