ldap

ldap is the lightweight directory access protocol. It provides access to an X.500 directory, or to a stand-alone LDAP server.
You can use the ldap kioslave as follows:

\texttt{ldap://host:port/ou=People, o=where, c=de??sub} for a subtree-query

or \texttt{ldap://host:port/cn=MM, ou=People, o=where, c=de??base} for a complete branch.
