[mailto](#)

## **Contents**

## mailto

The kioslave mailto is responsible for launching the mail composer of your choice when you open a URL in the mailto scheme ([RFC6068](#)).

### Syntax

The syntax of a mailto URL follows the following pattern:

mailto:recipients?query

where recipients form a list of restricted SMTP address specifications, and the query part may contain one or more of the following parameters:

#### **&to=recipients**

Specifies additional recipients.

#### **&cc=recipients**

Specifies additional recipients of carbon copies.

#### **&bcc=recipients**

Specifies additional recipients of blind carbon copies. These recipients will receive the message, but all other recipients will not know about that.

#### **&body=text**

Specifies the text of the message. This text should not be long, as there may be hard limits on how long an URL may be.

#### **&subject=text**

Specifies the subject of the message.

### Example

```
mailto:info@kde.org?cc=kde@kde.org&subject=Thank%20you!&body=KDE%20rocks!%20How%20can%20I%20help%3F
```

### Configuration

Choose the application to handle mailto locators in System Settings module **Applications** → **Default Applications** in the category **Personalization**.
