File Search

This System Settings module allows you to configure which files should be indexed for fast searching. It internally uses a technology called Baloo to efficiently search through the files.

Add the widget **Search** to your panel or enable the search in KRunner to use the indexing results for faster access to your documents.

Do not search in these locations

You are presented with a list of folders which should not be searched. By default only your entire `$HOME` folder is indexed, and no other folders or drives are indexed.

Removable media is never indexed by default. It can be explicitly removed from the list of exclude folders and it will then be indexed.

By default **Enable File Search** is activated, uncheck this setting if you do not want to use the file search at all.

Use **Also index file content** to also index the file contents additional to the file names.

For more info about additional configuration options e.g. how to add a drive mounted outside your `$HOME` folder please read [Baloo/Configuration](#).
