Abstract

KAppTemplate is a generator of new software projects using templates.

Chapter 1

Introduction

KAppTemplate is an application to start development quickly using existing templates providing basic repeatedly written code and a proper structure.

KAppTemplate picks up templates which are installed on your machine. Those are often part of the development files for libraries or can be downloaded e.g. from the website store.kde.org.

Answer the wizard questions on each page and generate your template.

NOTE

A `README` file in each template will allow you to find out how to build the template. It will also give you links for tutorials related to the project. After the project is generated, KAppTemplate's job is finished and you are on your own to build it.

Chapter 2

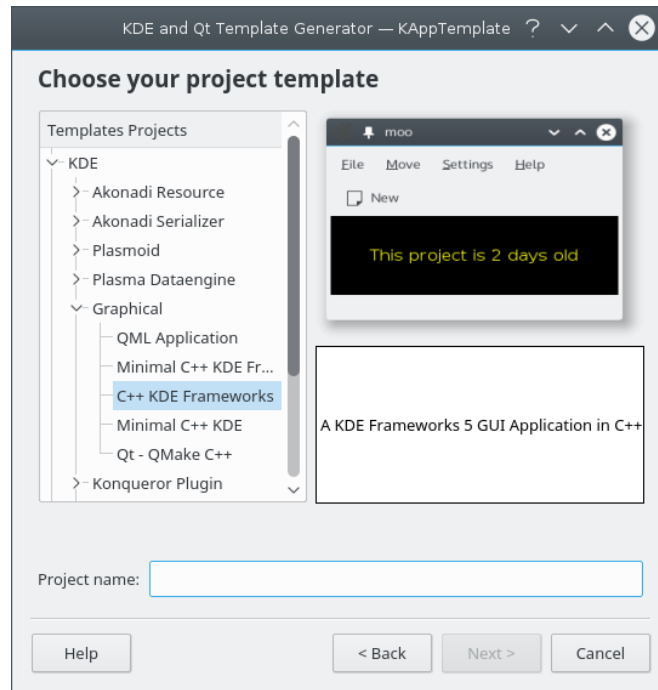

Using KAppTemplate

KAppTemplate is a wizard. The first page of the wizard explains you that KAppTemplate will generate a base project. Click **Next** to start generating your project. **Cancel** will stop the program and quit it. **Help** will display this help handbook in KHelpCenter.

The second page lists the available templates. On the right you can see the template preview and below the template description. After you chose your template, you are invited to enter the project name in the field at the bottom.

The KAppTemplate Handbook

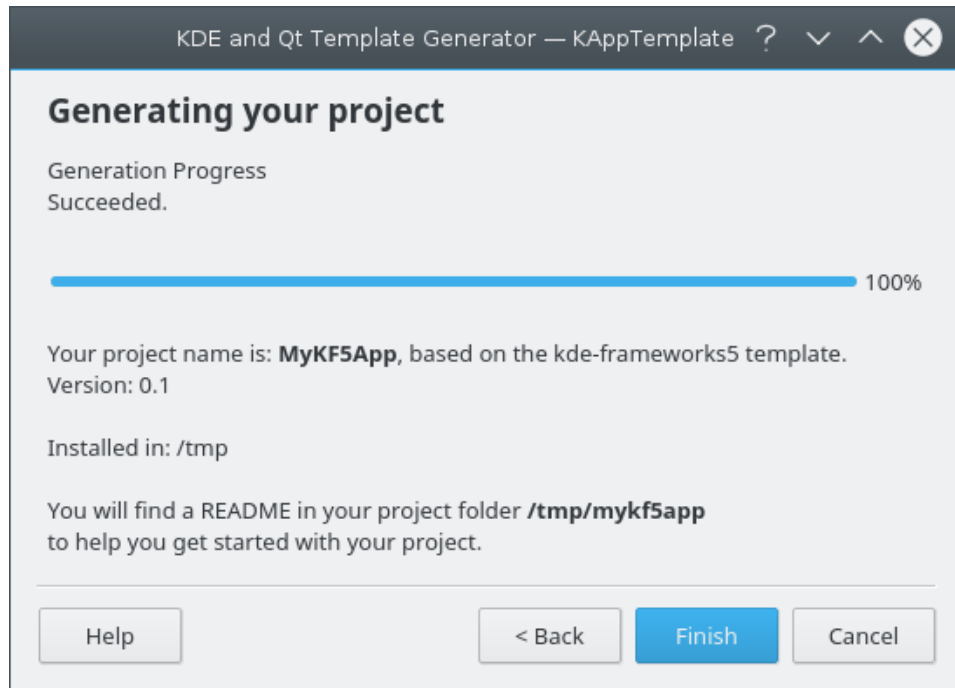

On the third page, you are asked for the project version, the source folder and the author name and email. If you filled System Settings tab about your personal information, it will be taken from there as default.

The fourth and last page gives you some feedback about the project generation.

The KAppTemplate Handbook

Then click **Finish** to close KAppTemplate.
