SMB

Alexander Neundorf
SMB
The smb worker enables you to browse the shares of a Windows® (or Samba) network.
To see the workgroups, enter smb://.
smb:// a_workgroup will list the hosts in this workgroup.
To see the shares of a host, enter smb:// the_host or smb:// a_workgroup / the_host.
To access a share directly enter smb:// the_host/the_share or smb:// a_workgroup /
the_host / the_share

The smb worker requires that you have libsmbc to use this worker.
You can set your default user name and password in the System Settings category Network in Connectivity → Windows Shares. This is especially useful if you are a member of a Windows® NT domain. There you can also set your workgroup name, but in most cases this is not required.
The worker will ask for your username and password if a default is not set.
